

TOGAF Practitioner - GoodNotes-style DETAILED Study Notebook

Format: Each video/lesson from the transcript is one page. Each page follows your rules: notebook-style headings, callouts, ASCII sketches, analogy, visual sketch, real-world example, exam relevance, flashcards, practice questions, one-page revision and 8 memory bullets to remember in 30 days. Pages are concise but detailed enough for study and spaced repetition.

Introduction & Course Structure

Big Picture

- TOGAF helps enterprises plan & govern change to realize business value.

Key Concepts

- **Purpose:** guide effective change via current vs target state and governance.
 - **Analogy:** City master plan - shows what to build, when, and who approves.

Visual sketch (ASCII):

```
[Baseline] --gap--> [Target]
      |               |
      models         roadmaps
```

- Stakeholders & Governance
 - **Real-world:** Execs approve vision; EA team writes roadmap and manages risks.
 - **Exam relevance:** Understand role of Request for Architecture Work and Statement of Architecture Work.

Why It Matters

- Prevents wasted projects, aligns investments, reduces risk.

Process Flow (mini)

- Request -> Preliminary -> Phase A (Vision) -> B-D (domain architectures) -> E/F (roadmap & migration)

Common Mistakes

- Over-scoping the first architecture project.
- Skipping stakeholder confirmation.

Visual Memory Hooks

- **Icon set:** □ (map) (vision) (iteration)

Flashcards

Q: What triggers an ADM cycle? A: Request for Architecture Work.

Practice Questions

Q: What is the Statement of Architecture Work for? (Short answer)

One-Page Revision

- EA = map; Vision = direction; ADM = method; Repo = single source

What to remember 30 days from now

- EA guides change to deliver value
- Request starts ADM
- Vision must be stakeholder-aligned
- Keep scope minimal
- Use repository first
- Roadmaps show transitions
- Contracts ensure compliance
- Measure value, not just outputs

TOGAF Core Concepts (levels, continuum, states)

Big Picture

- Organize large landscapes using levels (strategic/segment/capability) and continuum (generic->specific).

Key Concepts

- Architecture Levels
 - **Analogy:** Map zoom (world -> country -> city)

ASCII:
 [Strategic]
 |
 [Segment]
 |
 [Capability]

- **Example:** Strategic defines enterprise vision; capability defines a payroll process.
- **Exam:** Identify correct scope & time horizon per level.
- Architecture Continuum
 - **Analogy:** Reference library -> custom design
 - **Visual:** Generic <--- foundation --- Specific
 - **Use:** Promote reuse and reduce redundancy.
- **Architecture States:** Baseline, Transition(s), Target, Candidate, Resting
 - **Real-world:** Baseline = legacy systems; transition = phased migration; target = new cloud platform.

Why It Matters

- Choose right granularity and reuse models to save time.

Process tips

- Only update landscape when a justified project requests it; avoid speculative work.

Common Mistakes

- Mixing levels in a single model; over-detailing strategic architectures.

Flashcards

Q: Name 3 architecture levels. A: Strategic, Segment, Capability.

Practice Question

Given scenario with enterprise-wide vision, which level to use? (Strategic)

One-Page Revision

- Levels = breadth vs detail; Continuum = reuse; States = baseline->target

30-day bullets

- 3 levels & their purpose
- Continuum = generic->specific
- Baseline vs target distinction
- Use models for storytelling
- Roadmaps come from gaps
- Maintain approved architectures
- Scope projects to requests
- Reuse rather than redesign

Architecture Development Method (ADM) - Overview + Phase A deep dive

Big Picture

- ADM is the stepwise cycle to develop and maintain architecture.

Key Concepts

- ADM sequence (A->B->C->D->E->F->G->H) with Requirements Management at center.
 - **Analogy:** Project lifecycle with gates and reviews.

```
ASCII:  
  (Reqs)  
    *  
  A -> B -> C -> D -> E -> F -> G -> H
```

- **Phase A (Architecture Vision):** essential exam focus
 - **Steps:** scope -> identify stakeholders & concerns -> confirm goals/drivers -> develop vision -> statement of architecture work
 - **Analogy:** Pitch deck that gets executive buy-in.
 - **Visual:** [Stakeholder map] -> [High-level baseline/target] -> [Vision summary]
 - **Real World:** If stakeholders disagree, the project stalls; align early.
 - **Exam relevance:** know inputs (request for architecture work, principles, repository) and outputs (Statement of Architecture Work, Architecture Vision, Communication Plan).

Why It Matters

- Phase A sets the contract and scope - errors here amplify downstream.

Process Flow (Phase A condensed)

- Receive request -> Scope (breadth/depth/time) -> Stakeholders -> Team capability check -> Draft vision -> Secure approval

Common Mistakes

- Failing to scope breadth/time properly; insufficient stakeholder map.

Flashcards

Q: Primary output of Phase A? A: Statement of Architecture Work + Architecture Vision.

Practice Questions

Scenario: Sponsor provides a vague request - what step next? (Scope & stakeholder identification)

One-Page Revision

- Memorize Phase A steps and artifacts; find Statement of Architecture Work in exam.

30-day bullets

- Phase A establishes the project
- Statement of Architecture Work = contract
- Stakeholder map directs views
- Use repository assets early
- Scope breadth vs depth tradeoff
- Confirm team capability early
- Vision summarizes value & KPIs
- Communication Plan = who, when, how

Worked Example - Phase A (quick)

Scenario: Sponsor requests 'improve customer onboarding' across two business units.

Steps: 1) Scope breadth: org units A+B; 2) Stakeholders: Head of Sales, Head of Ops, CIO; 3) Baseline: current onboarding flow; 4) Draft vision: reduce onboarding time by 50% in 12 months; 5) Outputs: Statement of Architecture Work, stakeholder map, initial KPIs.

Quick ASCII Sketch (Phase A stakeholder map)

```
[Sponsor]
  |
[Head Sales] - [Head Ops] - [CIO]
  \           |           /
```

---- [EA Team] ----

Inputs & Outputs (Phase A) - study checklist

Key Inputs:

Request for Architecture Work (formal trigger)

Business goals & strategies

Applicable principles & constraints

Existing repository assets (reference models, templates)

Key Outputs:

Statement of Architecture Work (SoAW)

Architecture Vision (1-page summary + KPIs)

Communication Plan (stakeholder messages & schedule)

Phase A: Quick checklist for study & exam (tick list)

Confirm trigger & sponsor

Define scope (org units, capabilities, time horizon)

Identify top 8 stakeholders and their concerns

Draft measurable vision (SMART goal + 2 KPIs)

Identify one reusable repo asset per deliverable

Produce SoAW with success criteria and governance points

Sample stakeholder concerns (common exam patterns)

Sponsor: ROI, time-to-value, executive visibility

CIO: integration risk, infra readiness, licensing

Head Ops: process disruption, training, SLA impact

Head Sales: customer experience, reporting needs

Extra Flashcards - Phase A

Q: Name two non-architectural inputs to Phase A. A: Request for Architecture Work, business drivers/goals.

Q: What's the main purpose of the Communication Plan? A: Deliver right info to right stakeholders at right time.

Phase B: Business Architecture (details & techniques)

Big Picture

- Business architecture defines capabilities, value streams, org maps, and processes that target the business strategy.

Key Concepts & Techniques

- Business Capability Map
 - **Analogy:** Catalog of abilities
 - **ASCII (mini):** [Strategic] - [Core] - [Supporting]
 - **Use:** Heatmap capabilities by maturity/value/cost.
- Value Streams
 - **Analogy:** Conveyor belt of perceived stakeholder value

ASCII: Advertise -> Select -> Pay -> Deliver

- Map stages to capabilities and processes.
- Information Mapping (nouns->entities)
 - **Tip:** Use noun-challenge to extract key data entities.
- Organization Map vs Org Chart
 - Org map shows interactions across boundaries (not hierarchy).

Approach (GAP method)

- Baseline -> Target -> Gap Analysis -> Candidate roadmap components -> Impact resolution -> Stakeholder review

Real-world pointers

- Use existing assets (reference models) in the repo; avoid reinventing models.

Exam Relevance

Know artifacts: capability map, value streams, information maps, and typical matrices used in Phase B.

Common Mistakes

- Overly detailed baselines; inconsistent levels of detail between baseline and target.

Flashcard

Q: What technique links capabilities to value stream stages? A: Mapping & matrices (capability □ value stream)

Practice Qs

Short scenario: Which artifact helps show which org unit supports which capability? (Org map)

One-Page Revision

- Build baseline only to necessary level; use same level of detail for baseline & target.

30-day bullets

- Capabilities = business abilities
- Value streams show stakeholder-perceived flow
- Info map = nouns -> relationships
- Org map = network of actors
- Heatmaps show priority/maturity
- Reuse industry reference models
- Gap->work packages->roadmap
- Stakeholder approval needed for target

Worked Example - Business Capability Mapping

Problem: Sales process has duplicated capabilities across regions.

Steps: 1) Create level-1 capability map; 2) Heatmap for duplication (red = duplicated); 3) Propose consolidation work package; 4) Map to org units and applications.

ASCII: Capability heatmap legend
[Green]=good [Yellow]=improve [Red]=missing/duplicated

Capability mapping: practical steps & mini-example

Steps:

1. List Level-1 capabilities (e.g., Lead Mgmt, Quote, Order Fulfilment, Billing)
2. For each region, mark presence/ownership and maturity (1-5)
3. Produce heatmap: color by duplication or misalignment
4. Identify consolidation candidates (same capability, different apps)
5. Draft Work Package: Consolidate Capabilities - Pilot Region

Mini-example (table style)

Capability	Region A owner	Region B owner	Maturity A	Maturity B	Action
Lead Mgmt	Sales A	Sales B	4	2	Consolidate -> Pilot
Billing	Finance A	Finance B	3	3	Standardize interfaces

Study tip: when asked to show a capability heatmap in exam, sketch two columns (capability vs regions) and mark colors/maturities - explain consolidation rationale.

Extra Flashcards - Phase B

Q: What does a value stream stage represent? A: An incremental value-adding activity for stakeholders.

Q: Why use an org map? A: To show cross-boundary interactions and responsibilities.

Phase C: Information Systems (Data & Application)

Big Picture

- Data and application architectures enable the business architecture.

Key Concepts

- **Data meta-model:** Data Entity, Logical Data Component, Physical Data Component
 - **Analogy:** Entity = noun, Logical grouping = folder, Physical = database/schema
 - **ASCII snippet:** Customer -> Contract -> Address
- **Application artifacts:** Application Portfolio Catalog, App Comm Diagram, App-Org Matrix

Data considerations

- Data at rest / in motion / in use / open data
- Governance, migration, quality attributes

App Architecture pointers

- Use industry models (TRM, TRIPLE-ERM) and vendor reference models to save time.

Exam relevance

Recognize which artifacts are data vs application; know purpose of logical vs physical models.

Common Mistakes

- Confusing entities with attributes; modelling too many attributes early.

Flashcard

Q: Three meta-model entities for data? A: Data entity, logical component, physical component.

Practice Q

Given requirements to share data enterprise-wide, which data principle supports this? (Data shared principle)

One-Page Revision

- Data meta-model + key diagrams + governance basics

30-day bullets

- Data entity != attribute
- Logical vs physical components
- Data migration & governance are vital
- App portfolio catalogs list logical & physical apps
- App communication diagrams show interfaces
- Use repo & reference models
- Keep data models concise at first
- Trace ownership for data entities

Worked Example - Data entity mapping

Scenario: 'Customer' entity used in Billing and CRM.

Steps: 1) List attributes used by both systems; 2) Decide canonical source (Authoritative Source = Billing); 3) Define data access policy & migration steps.

ASCII: Data flow (simple)
[Billing DB] --> (API) --> [CRM]

Extra Flashcards - Phase C

Q: When to use logical vs physical data models? A: Logical for design/requirements, physical for implementation details.

Q: What are three 'states' of data to consider? A: At rest, in motion, in use.

Phase D: Technology Architecture

Big Picture

- Technology architecture defines platforms, infrastructure, and standards to support apps & data.

Key Concepts

- Technology Portfolio Catalog, Platform Decomposition, Environments & Locations
 - **Analogy:** Building materials and utilities for the city

Considerations

- Technology can be a driver of change; anticipate innovation but manage discontinuities.

Exam relevance

Understand artifacts and when to apply them; TRM and platform decomposition diagrams.

Common Mistakes

- Letting technology push architecture without business alignment.

Flashcard

Q: Purpose of Technology Portfolio Catalog? A: Life-cycle management of tech products & standards basis.

Practice Q

Which diagram shows OS used at each location? (Environment & Location diagram)

One-Page Revision

- Tech = platforms + standards + lifecycle; map to apps & data.

30-day bullets

- Tech supports apps & data

- Platform decomposition shows building blocks
- Catalogue aids lifecycle mgmt
- Anticipate innovation benefits & risks
- Reuse standards library
- Map tech to locations/environments
- Keep diagrams logical, not overly detailed
- Align tech choices to business value

```
Visual sketch (ASCII): Platform stack (concise)
[Business Apps]
|
[Middleware / Services]
|
[Platform: Containers / App Servers]
|
[Infrastructure: VMs / Baremetal / Cloud]
|
[Network / Storage]
```

Study tip: label one platform with a standard (e.g., Kubernetes) and one tech component mapping to show traceability.

Phases E & F: Opportunities & Solutions / Migration Planning

Big Picture

- E identifies delivery vehicles and builds initial roadmap; F finalizes migration plan and order.

Key Concepts

- Consolidated Gaps, Solutions & Dependencies Matrix
- Implementation Factor Catalog
- Work Packages, Transition Architectures, Roadmap, Implementation & Migration Plan

Analogy

- **Road trip planning:** gaps = distance, work packages = legs, transition states = overnight stops.

Process Flow

- Consolidate gaps -> prioritize based on value/risk -> group into work packages -> define transitions -> timeline & costs -> confirm with stakeholders

Exam relevance

Know the matrix types and the purpose of work packages vs projects vs transition architectures.

Common Mistakes

- Ignoring dependencies; sequencing work incorrectly.

Flashcard

Q: What is a work package? A: Grouping of activities to realize capability increments.

Practice Q

How to choose greenfield vs evolutionary approach? (Based on constraints, risk, legacy)

One-Page Revision

- Use consolidated matrices; define clear outcomes for transitions.

30-day bullets

- Roadmap = timeline of work packages
- Consolidated gap matrix central to planning
- Dependencies define sequence
- Work packages → projects → portfolios
- Choose implementation approach per context
- Proof-of-concept = implementation, not architecture
- Cost/benefit & risk prioritize projects
- Update repo with roadmap outputs

Worked Example - Creating a Work Package

Gap: No shared CRM across regions; solution options: (A) Build in-house, (B) Buy SaaS, (C) Hybrid.

Steps: 1) Consolidate gaps; 2) Cost estimate + value index; 3) Define Work Package: "CRM consolidation - Phase 1 (pilot region)"; 4) Dependencies: Data migration, SSO, Org training.

```
ASCII: Work package -> dependencies
[Work Package: CRM P1]
|-- Data migration
|-- SSO integration
|-- Training
```

Extra Flashcards - E/F

Q: What table documents solution building blocks across transitions? A: Transition Architecture State Evolution table.

Q: Name a key input to Phase E. A: Candidate architecture roadmap components from B-D.

Phase G: Implementation Governance

Big Picture

- Ensure delivered solutions comply with the approved architecture.

Key Concepts

- Architecture Contract, Compliance Reviews, Post-Implementation Reviews

Analogy

- QA and inspections during construction: architect checks contractor.

Process Flow

- Confirm scope -> identify resources/skills -> guide deployment -> run compliance reviews -> publish post-implementation results

Exam relevance

Know compliance levels (irrelevant -> fully conformant -> non-conformant) and what a compliance review checks.

Common Mistakes

- Over-reliance on reviews without developer feedback loops.

Flashcard

Q: What is an architecture contract? A: Joint agreement on deliverables, quality, fitness.

Practice Q

Which artifact documents acceptance criteria for an architecture project? (Statement of Architecture Work)

One-Page Revision

- Governance enforces compliance; contracts define expectations.

30-day bullets

- Contracts connect architecture to implementation
- Compliance reviews at checkpoints
- Use repo to track decisions
- Train teams on expectations
- Update baseline once deployed
- Post-implementation reviews capture lessons
- Architecture board handles major approvals
- Use artifacts to demonstrate value

```
Visual sketch (ASCII): Deployment & compliance flow
[Design Approved]
|
[Dev & Test] --> [Compliance Review]
|               |
[Pre-Prod] -----+--> [Remediation/Approve]
|
[Production]
```

Quick note: mark compliance checkpoints at Dev/Test, Pre-Prod and Production for review dates.

Phase H & Requirements Management

Big Picture

- H manages change post-deployment; Requirements Management runs continuously across the ADM.

Key Concepts

- Change Requests, Value Realization, Monitoring, Risk & Classification (simplification, incremental, re-architecting)

Analogy

- Maintenance cycle & continuous backlog refinement.

Process Flow

- Monitor → assess → classify change → decide: small update or new ADM cycle

Exam relevance

Know change request content and how requirements feed phases.

Common Mistakes

- Not documenting change rationale or impact fully.

Flashcard

Q: Requirements repository purpose? A: Single point of truth for requirements across ADM cycles.

Practice Q

What triggers a new ADM cycle? (Major change/re-architecting request)

One-Page Revision

- Requirements are central; H decides whether to reopen ADM.

30-day bullets

- Requirements management is continuous
- Change requests must include impact assessment
- **Classify changes:** simplification/incremental/re-architect
- Value realization is measured & tracked
- Monitor performance KPIs
- Use governance to approve updates
- Document lessons & decisions
- Keep requirements repo current

Visual sketch (ASCII): Change request lifecycle

```
[Change Raised]
|
[Impact Assessment] --(minor)-> [Implement]
| --(major)-> [New ADM?]
|
[Approval] -> [Plan & Schedule] -> [Implement]
```

Study tip: in exams, briefly outline impact assessment steps and decision criteria for new ADM vs direct implement.

Techniques: Gap Analysis, Trade-offs, Business Scenario

Big Picture

- Concrete techniques help derive actionable roadmap items.

Key Concepts

- **Gap analysis:** eliminated/new/impacted building blocks
- **Architecture Trade-Off Method:** define criteria -> investigate alternatives -> select/merge
- **Business Scenario Technique:** SMART scenarios drive architecture requirements

Analogy

- Gap = pothole on the road; trade-off = choosing speed vs cost.

Exam relevance

Demonstrate trade-off facilitation and ability to justify alternatives with criteria.

Common Mistakes

- Using subjective criteria without agreed weighting.

Flashcard

Q: 3 steps of trade-off method? A: Select criteria -> define alternatives -> select/assemble best.

Practice Q

Given two alternatives with similar value, what do you examine next? (Dependencies, risk, stakeholder priorities)

One-Page Revision

- Document criteria, estimate gaps, perform stakeholder review.

30-day bullets

- Gap types & examples
- Trade-offs require shared value metrics
- Business scenario = SMART
- Use matrices to consolidate gaps
- Weighting criteria is essential
- Engage stakeholders early in trade-offs
- Document chosen alternative & rationale
- Reuse viewpoints for stakeholder views

Worked Example - Trade-off Analysis (compact)

Decision: Replace legacy ERP vs wrap with API layer.

Criteria: Cost (30%), Time (25%), Risk (25%), Strategic fit (20%).

Scores: Replace (7,5,6,8) -> weighted = $(2.1+1.25+1.5+1.6)=6.45$

Wrap (5,8,7,6) -> weighted = $(1.5+2.0+1.75+1.2)=6.45$

Result: tie -> use secondary criteria: organizational readiness -> choose Wrap + plan for Rep

ASCII: Trade-off table (mini)

Criteria	Replace	Wrap
Cost	7	5
Time	5	8
Risk	6	7
Fit	8	6

Trade-off scoring: formula & tie-break rules (study-ready)

- **Weighted score formula:** $\text{WeightedScore} = \sum(\text{weight}_i * \text{score}_i)$ for all criteria i .
 - Normalise weights so they sum to 1 (or use percentage weights as shown).
 - Use consistent scoring scale (1-9 or 1-10) and document scale in answer.

Tie-break guidance (exam):

1. Use secondary criterion (e.g., organizational readiness, compliance) pre-agreed with stakeholders.
2. If still tied, prefer approach with smaller implementation risk or shorter time-to-value.
3. Document rationale concisely: show weighted scores, secondary criteria and final rationale.

Quick exam phrasing tip: "I used criteria A-D with weights X; scored alternatives out of 9; weighted totals tie; selected Wrap due to higher organizational readiness and lower up-front cost, with plan to revisit for full replacement in roadmap."

Extra Flashcards - Techniques

Q: What secondary step after scoring equals? A: Use secondary criteria or stakeholder negotiation.

Q: What is the purpose of the consolidated gap matrix? A: Group gaps and map to potential solutions and dependencies.

Security & Risk (summary)

Big Picture

- Security architecture is pervasive; risk management is integral to all ADM phases.

Key Concepts

- Security Service Catalog, Trust Framework, Risk Register, Controls & Audit

Analogy

- Safety protocols built into building codes.

Process Flow

- Capture security requirements in Phase A → design controls in B-D → test & audit in G → monitor in H

Exam relevance

Know difference between business vs cyber risk; classification and mitigation planning.

Common Mistakes

- Adding security late; not mapping controls to assets.

Flashcard

Q: Risk assessment dimensions? A: Effect × Frequency (→ initial risk classification)

Practice Q

Where to record security building blocks? (Security Service Catalog / Repository)

One-Page Revision

- Security = design + controls + monitoring + awareness.

30-day bullets

- Security crosses all phases
- Use security service catalog
- Risk = effect × frequency
- Controls trace to assets & services
- Audit & pen tests in Phase G
- Training & awareness are required
- Include security in migration planning
- Update repo with security classifications

Worked Example - Risk Assessment (compact)

Asset: Customer PII in CRM; Threat: Data breach; Effect = Critical, Frequency = Occasional → Initial risk = High.

Mitigations: Encryption at rest & in transit, IAM controls, regular pen tests.

ASCII: Risk matrix (qualitative)

Impact \ Likelihood

	Likely	Occasional	Unlikely
High	X	X	
Med		X	

Risk scoring: simple numerical example (study-ready)

Use numeric scales for repeatable answers:

Impact: 1 (Low), 2 (Medium), 3 (High)

Likelihood: 1 (Unlikely), 2 (Occasional), 3 (Likely)

Risk score = Impact × Likelihood (1-9)

Example: Customer PII → Impact=3, Likelihood=2 → Risk=6 (High/Action)

Mitigation mapping (short)

- **Controls:** Encryption, IAM, Logging
- **Residual risk calculation:** ResidualRisk = InitialRisk × (1 - Effectiveness)
 - If controls reduce likelihood by 50% (Effectiveness=0.5): ResidualRisk=6 × 0.5 = 3 (Medium)

Exam tip: show quick math and mitigation mapping - $\text{impact} \times \text{likelihood}$, list 2-3 controls, give residual score and recommended next step (accept/mitigate/transfer).

Extra Flashcards - Security

Q: What does IAM stand for? A: Identity and Access Management.

Q: Where to record mitigation decisions? A: Governance repository / Implementation Factor Catalog.

Architecture Repository, Standards & Metamodel

Big Picture

- Repository stores landscapes, standards, governance logs, requirements, and SBS.

Key Concepts

- Standards lifecycle (proposed → provisional → standard → phasing out → retired)
- Enterprise metamodel = types & relationships; supports traceability & completeness.

Analogy

- Repo = indexed library with version control.

Exam relevance

Know repository elements and what goes in each section.

Common Mistakes

- Uncontrolled duplication and no versioning.

Flashcard

Q: Three classes of standards? A: Legal/regulatory, Industry, Organizational.

Practice Q

Which repository element holds decision logs? (Governance repository)

One-Page Revision

- Keep repo tidy, versioned, and accessible.

30-day bullets

- Repo = single source
- Standards classified & lifecycle-managed

- Metamodel supports completeness checks
- Governance repo stores decision logs
- Requirements repo central for ADM
- SBS stored in resolution landscape
- Use repo assets before creating new ones
- Keep templates & viewpoints reusable

Visual sketch (ASCII): Repository structure (example)

```

/repository
  /landscapes
    /strategic
    /segment
  /standards
    /api-security
    /data-governance
  /reference
    /templates
    /viewpoints
  /requirements
  /governance

```

Study tip: point to a file path in the repo when answering exam scenarios to show traceability (e.g., /repository/standards/api-security.md).

Enterprise metamodel: quick example (study-ready)

Types: Capability, Application Component, Data Entity, Technology Component, Requirement, Work Package

Example relationships (triples):

Capability "realized by" Application Component

Application Component "uses" Data Entity

Work Package "implements" Requirement

Standards lifecycle entry example

Standard: "REST API security standard"

Status: Provisional

Owner: Security Architecture Board

Effective date: 2026-01-01

Rationale: Align APIs to enterprise IAM

Deprecation plan: Review in 12 months

Study tip: in exam scenarios, point to metamodel triples to show traceability from stakeholder

Exam Preparation & Time Management (detailed)

Big Picture

- Part 2 exam tests application of TOGAF in scenarios; practice under exam conditions.

Key Tips

- Use TOC of provided PDFs for quick lookup.
- **Time strategy:** allocate ~11 min / question; skip and return to hard ones.
- **Question strategy:** identify ADM phase and stakeholder concerns, eliminate distractors.

Practice Drill

Simulate 8-question sets under 90 minutes; review incorrect answers and map to phases/artifacts.

Flashcard

Q: Passing score? A: 24/40 (60%)

One-Page Revision

- Practice, timeboxing, TOC navigation skills.

30-day bullets

- Simulate full exam conditions
- Learn TOC positions for quick lookup
- Identify ADM phase from scenario
- Eliminate obviously wrong answers first
- Use repository references when allowed
- Check remaining time & review
- Prioritize quick wins
- Learn to extract facts from scenarios

Visual sketch (ASCII): Exam timebox matrix
[90 minutes total]

Question 1-2: 20m	Quick wins
Question 3-6: 44m	Mid-depth
Question 7-8: 26m	Deep thought

Exam tip: flag hard questions and return; use first 10 minutes to scan all 8 scenarios for quick wins

Exam Drill - Quick Checklist (during exam)

- 1) Identify ADM phase(s) in scenario
- 2) List 3 affected stakeholders & their concerns
- 3) Find the artifact most likely required (e.g., Statement of Architecture Work, Roadmap, Requirements Spec)
- 4) Eliminate options that conflict with principles or constraints
- 5) Choose best-fit and note rationale in margin

Extra Flashcards - Exam Prep

Q: How many questions in part 2? A: 8 scenario-based questions.

Q: What's the passing %? A: 60% (24/40).

-- End of notebook --

If you want: I can export this file into separate GoodNotes pages (PDF) or split into one markdown file per video. Which export would you like next?

-- Additional per-lesson pages (expanded) --

-- Page: Course Structure (lesson)

Big Picture

- Course organized in nine sections; this lesson orients on structure and goals.

Key Points

- **Course map:** Intro -> Core concepts -> ADM -> Techniques -> Content -> Capability -> Security -> Exam prep
 - **Analogy:** Course = roadmap; each section a milestone.

Visual (ASCII): [Intro] -> [Core] -> [ADM] -> [Techniques] -> [Exam]

Why It Matters

- Knowing structure helps chunk study sessions and schedule spaced repetition.

Exam relevance

Recognize which sections produce which artifacts.

Practice Q

How many sections are in the course? (Answer: 9 main sections)

30-day bullets

- Use roadmap to plan study sessions
- Prioritize ADM phases for practice
- Map videos to practice flashcards

Visual sketch (ASCII): Course map (chunking)
[Intro] -> [Core Concepts] -> [ADM] -> [Techniques] -> [Exam Prep]

Study tip: plan 30-60 minute sessions per chunk; review flashcards after each chunk.

Big Picture

- **Two instructors:** practical consultant and academic researcher - both bring applied examples.

Key Points

- Their backgrounds (consulting, PhD) signal balance of practice and theory.
 - **Real-world tip:** Listen for their examples; instructors often hint at exam-relevant distinctions.

Why It Matters

- Instructor emphasis signals exam focus (practical governance, artifacts).

Flashcard

Q: Why note instructor background? A: It indicates practical vs theoretical emphasis.

30-day bullets

- Note recurring real-world examples
- Track instructor tips for exam prep

Visual sketch (ASCII): Instructor signal map
[Instructor A: Practical] ---> real-world tips, governance examples
[Instructor B: Academic] ---> theory, definitions, exam rationale

Study tip: tag instructor quotes in notes as "practical" vs "theory" for quick review.

-- Page: Certification Program (lesson)

Big Picture

- Part 2 is scenario-based, open-book, 8 complex questions, 90 minutes (+60 if ESL).

Key Facts

- **Scoring:** best=5, second=3, third=1, distractor=0; pass = 24/40 (60%).
- Use provided PDFs; learn TOC navigation.

Exam Tips

Practice finding terms in the provided PDFs quickly; bookmark common artifacts.

Practice Q

What is the point structure for the best answer? (5 points)

30-day bullets

- 8 scenario questions, 90 minutes
- Passing score 24/40
- **Open-book:** get fast at TOC lookup

Visual sketch (ASCII): Exam essentials checklist
[Format: 8 scenario Qs] [Time: 90m] [Open-book: PDFs]
[Scoring: 5/3/1/0] [Pass: 24/40]

Study tip: create a single-page cheat sheet with TOC anchors to common artifacts.

-- Page: Enterprise Architecture Purpose (lesson)

Big Picture

- EA guides change by describing baseline, target, and gaps; supports governance of change.

Key Concepts

- **Purpose:** align change to value, direct and control change activity, enable governance and risk mgmt.
 - **Analogies:** Map + governance compass.

Real-World

- Use EA to decide retire or upgrade legacy systems by tracing value.

Exam relevance

Expect scenario questions asking about governance roles and outputs.

30-day bullets

- EA = baseline vs target
- Governance = direction + control
- Traceability to value is essential

```
Visual sketch (ASCII): Baseline -> Gap -> Target (value link)
[Baseline] --(gaps)-> [Target]
    |                   |
    |                   |
[Assets]               [Value Delivered]
```

Study tip: when answering exam scenarios, always map requirements to value delivery steps.

-- Page: Enterprise Architecture Landscape (lesson)

Big Picture

- Landscape is composed of multiple models and views populated over time via projects.

Key Concepts

- Models trade-off formality vs purpose; reuse is key; landscapes updated per projects only.

Visual Hook

- **Multi-model stack:** diagrams, catalogs, matrices, roadmaps.

Exam relevance

Know that landscapes are developed incrementally - not all at once.

Practice Q

Why not build the whole landscape proactively? (Answer: waste of effort without need)

30-day bullets

- Landscape = many connected models
- Formal models enable reuse
- Update per project

Visual sketch (ASCII): Model stack

[Catalogs]

[Diagrams]

[Matrices]

[Roadmaps]

Study tip: in a scenario, call out which model provides the quickest evidence (e.g., catalog vs diagram).

-- Page: Architecture States (lesson)

Big Picture

- Baseline, Candidate, Transition(s), Target, Resting states capture approval and realization status.

Key Concepts

- Transition architectures provide milestones and measurable business value.

Analogy

- **Staircase:** each step = transition architecture toward the top (target).

Exam relevance

Roadmaps and transition architecture timing questions likely.

Practice Q

What is a resting architecture? (A state with value even if change activity pauses)

30-day bullets

- Baseline = current reference
- Target = approved future
- Transition = incremental states

Visual sketch (ASCII): Staircase to Target
[Baseline] -> [Transition1] -> [Transition2] -> [Target]

Study tip: identify measurable outcomes for each transition in answers (time, capability, KPI).

-- Page: Digital Enterprise (lesson)

Big Picture

- Four contexts for digital enterprise maturity: individual founder -> team -> teams of teams -> enduring enterprise.

Key Concepts

- Each context has different EA focus: concept, product mgmt, coordination, governance & compliance.

Real-World

- Small startups emphasize rapid delivery; large enterprises emphasize governance and risk.

Exam relevance

Recognize appropriate EA focus per organizational context.

30-day bullets

- **4 contexts:** founder, team, teams-of-teams, enduring
- Focus shifts from product to governance

Visual sketch (ASCII): Context maturity funnel
Founder -> Team -> Teams-of-teams -> Enduring

Study tip: match architecture emphasis (speed vs governance) to context in scenarios.

-- Page: Preliminary Phase (lesson)

Big Picture

- **Build architecture capability:** org model, tools, principles, governance baseline.

Key Steps

- Review org context, scope affected elements, define roles, tailor TOGAF, set maturity targets.

Analogy

- Set up workshop before starting a big program - define who, how, what.

Exam relevance

Know that preliminary is about capability, not a deliverable architecture.

Practice Q

What is a primary output of preliminary phase? (Answer: tailored architecture framework and principles)

30-day bullets

- Define org model and processes
- Set architecture principles
- Tailor TOGAF to org needs

Visual sketch (ASCII): Capability setup checklist
[Org model] [Tools] [Principles] [Governance Board] [Templates]

Study tip: list 3 tailoring decisions and justify them by org constraints in exam answers.

Big Picture

- **Iterations manage complexity:** full ADM cycles, development iterations, capability iterations, transition planning iterations.

Key Points

- Use iterations to converge on detail only where needed; combine strategies (concurrent cycles + nested iterations).

Exam relevance

Expect scenario where iteration choice affects scope and governance.

Practice Q

When to run a preliminary-phase iteration? (If capability or principles need updating)

30-day bullets

- **Iteration types:** full ADM, development, capability, governance, transition
- Iterate to reduce risk and focus effort

Visual sketch (ASCII): Nested iterations model
[Full ADM]
 [Development iterations]
 [Capability mini-iterations]

Study tip: explain iteration choice by risk, stakeholder readiness and delivery cadence.

Big Picture

- Structured way to derive architecture requirements from business problems (SMART criteria).

Key Steps

- Premise formulation → initial verification → refinement; document actors, outcomes, environment, value streams.

Exam relevance

Use scenario technique to justify architecture choices in exam questions.

Practice Q

What does SMART stand for? (Specific, Measurable, Actionable, Realistic, Time-bound)

30-day bullets

- Business scenarios inform requirements
- Use noun challenge for info concepts
- Iterate until fit-for-purpose

Visual sketch (ASCII): Business Scenario template

Premise: _____

Actors: ____ | Outcomes: ____ | Value: ____ | Timebox: ____

Study tip: in exam answers, format one-line business scenario using this template before proposing requirements.

-- Page: Gap Analysis (lesson)

Big Picture

- Identify accidental, deliberate, or open shortfalls between baseline and target.

Key Points

- Use metrics and matrices; classify gaps (eliminated/new/impacted) and create gap-closure options.

Exam relevance

Gap matrices often basis for roadmaps and work packages.

Practice Q

Name 2 gap types. (Eliminated, New)

30-day bullets

- Gaps drive work packages
- Use matrices to consolidate
- Map gaps to solutions & dependencies

Visual sketch (ASCII): Gap matrix (mini)

Capability	Baseline	Target	Gap	Work Package
X	2	4	+2	WP-123

Study tip: show one-row gap matrix in scenario answers to justify chosen work package.

-- Page: Architecture Trade-off (lesson)

Big Picture

- **Trade-off method:** choose criteria, define alternatives, assess impacts, and select/merge.

Key Steps

- Define evaluation criteria from vision/principles → model alternatives → stakeholder review → select.

Exam relevance

You may be asked to justify selection between alternatives using trade-off reasoning.

Practice Q

What are typical trade-off criteria? (Value, cost, risk, time, compliance)

30-day bullets

- Define criteria explicitly
- Weight criteria with stakeholders
- Document rationale for chosen alternative

Visual sketch (ASCII): Trade-off scoring (mini)

Criteria	Weight	Alt A score	Alt B score	Weighted A	Weighted B
Cost	30%	7	5	2.1	1.5

Study tip: always state the scoring scale and tie-breaker when writing trade-off answers.
